

I have been working as a machine vision engineer for 10 years. I have primarily been using traditional machine vision tools and have come across several problems that would have been better solved using AI. Outside my industry, it is exciting to see challenging real world vision problems being solved through AI. Through the skills and network gained through this course, I hope to further influence my organization to adopt AI in our industrial vision systems. Also, personally, I have a desire to upskill myself to be able to grow as a technical engineer in the field of computer vision.
